

improving people's environment

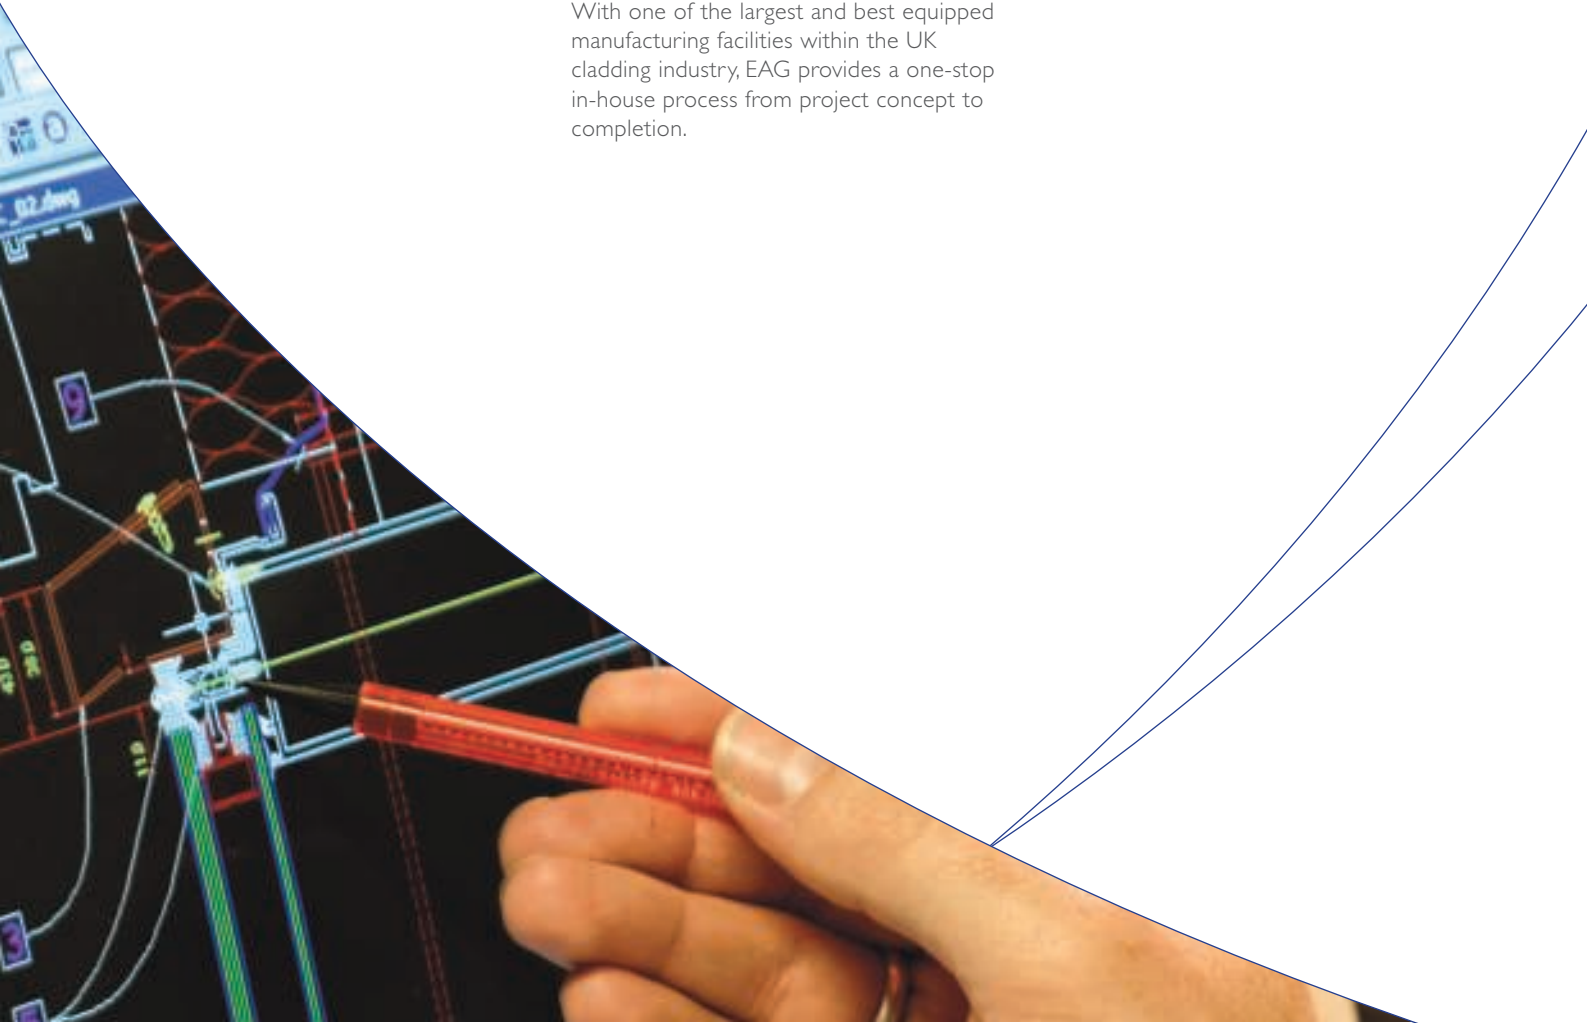

Founded in 1983 EAG specialises in design intensive envelope cladding packages to convert the most ambitious visions into innovative solutions.

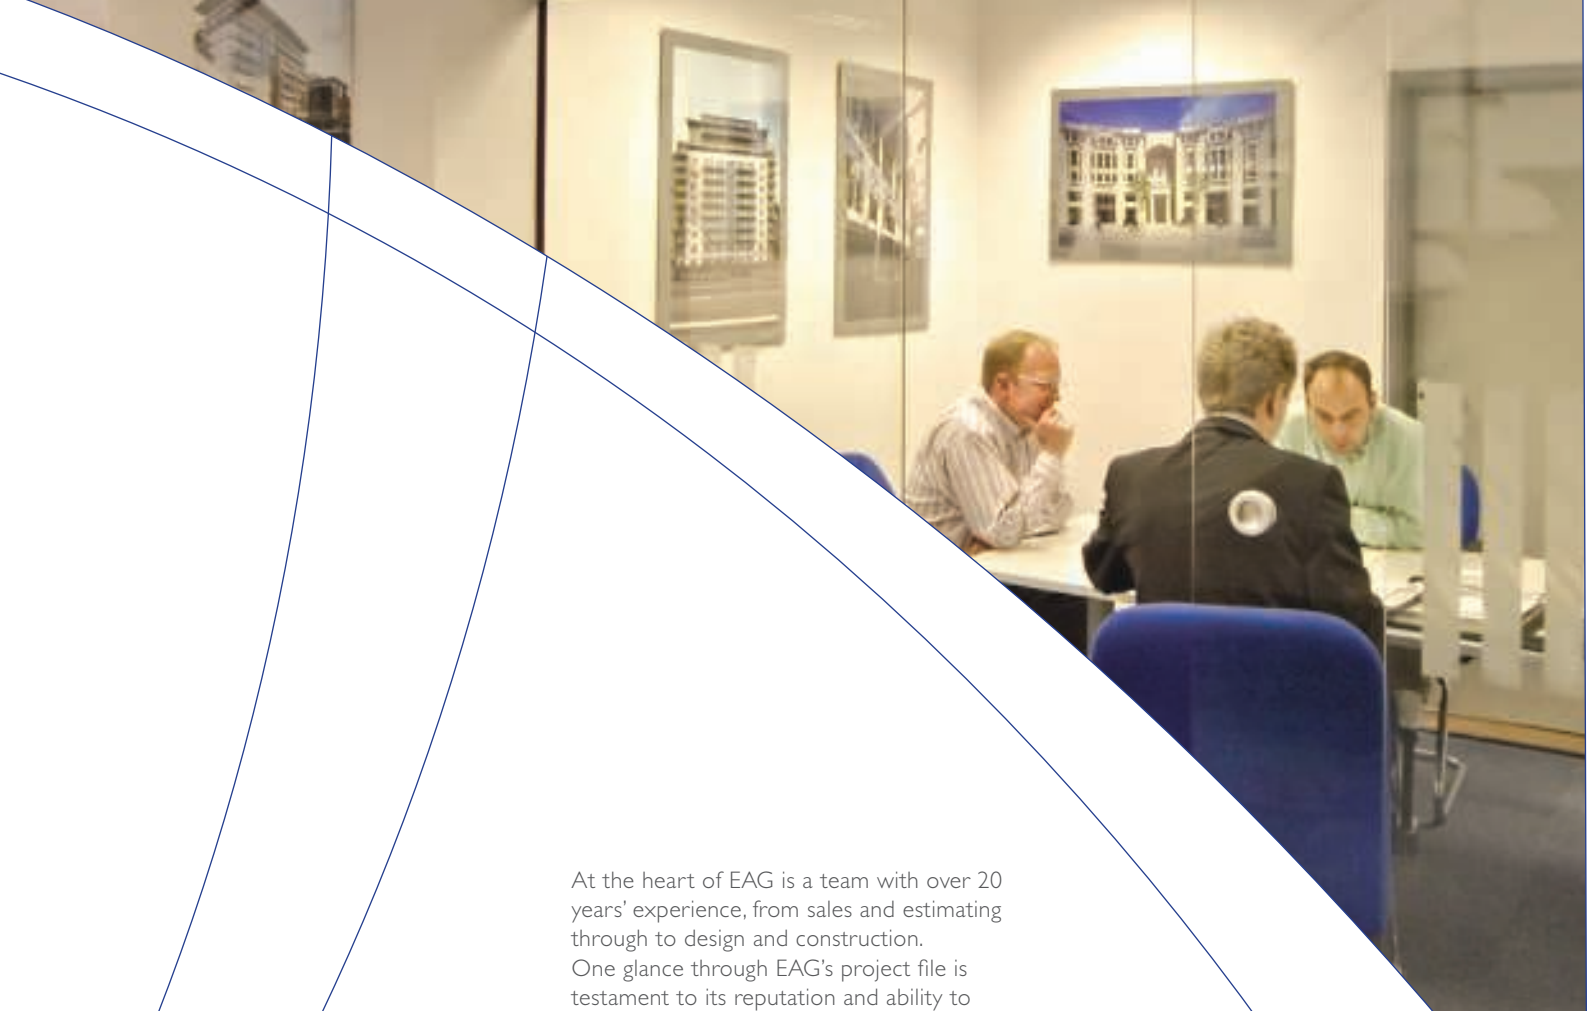

A full range of fenestration products are supplied comprising:

- Curtain walling, stick and unitised
- Windows
- Atria walling
- Atria roof glazing
- Stax structural glass systems
- Doors
- Sheet metal products
- Rain-screen panels

EAG creates facades for commercial and residential buildings concentrating on customer service and the one-to-one approach. Through engineering and design a cost effective and robustly detailed solution is delivered. Dedicated project management drives the company's ethos of single point communication and a commitment to inclusion of the design team and contractor in every step of the process.

With one of the largest and best equipped manufacturing facilities within the UK cladding industry, EAG provides a one-stop in-house process from project concept to completion.

At the heart of EAG is a team with over 20 years' experience, from sales and estimating through to design and construction. One glance through EAG's project file is testament to its reputation and ability to deliver complex total envelope projects.

Whilst working on high profile, complex projects EAG also retains a team focused on smaller scale jobs delivered to demanding lead times. EAG recognises the need for fully co-ordinated building envelope solutions and regularly incorporates a range of associated products, including:

- Secondary steel work
- Propriety cladding systems
- Brise soleil
- Automatic door systems
- Louvres and smoke vents
- Terracotta / timber cladding
- Pre-cast panels and unitised masonry

Continuous investment in the latest design systems is vital and EAG uses computer aided design tools to offer 3D modeling of complex projects. The software incorporates all components within the model and produces manufacturing part prints, glass maps and installation instruction diagrams automatically.

To compliment this, EAG also employs the best manufacture and fabrication equipment allowing it to handle everything from profile fabrication to dispatch from its 45,000 sq foot in-house facility.

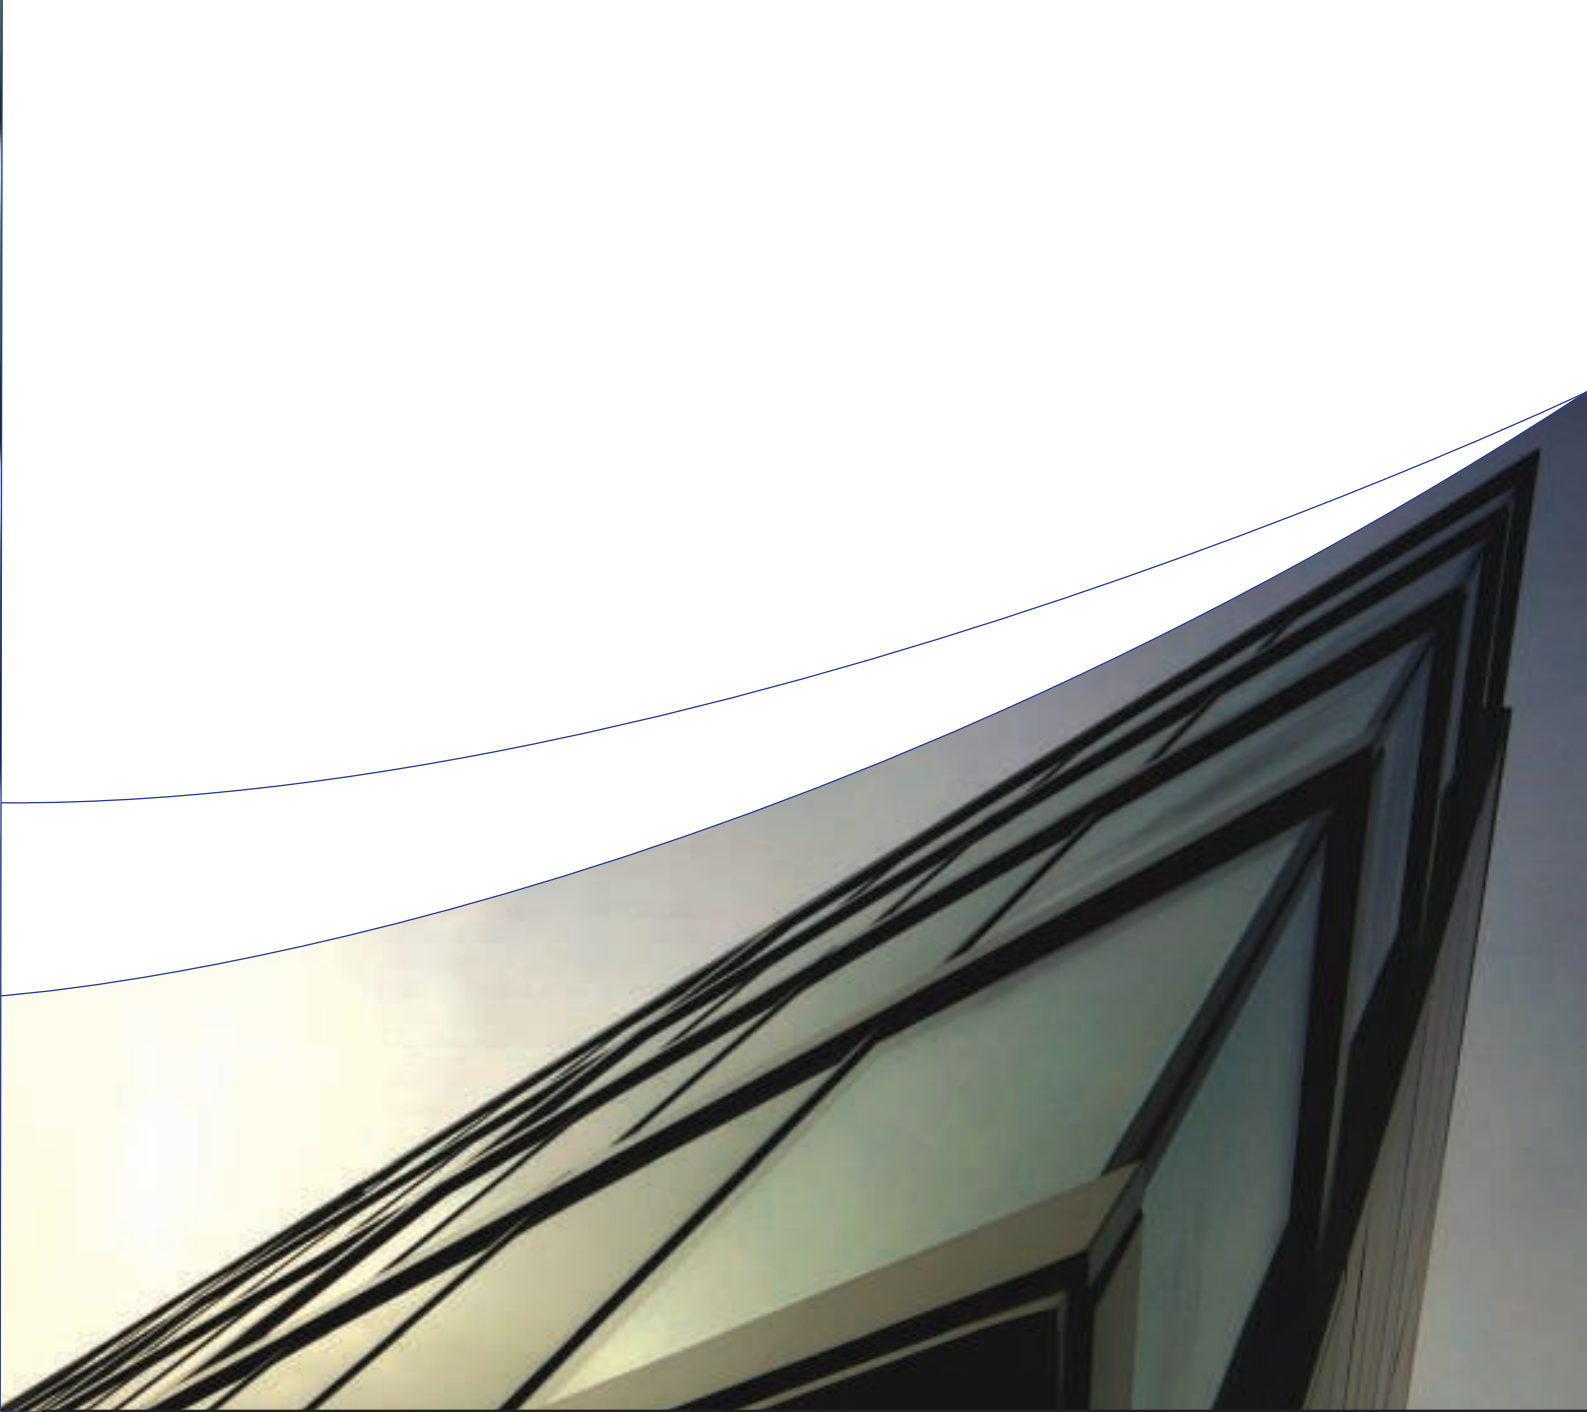

EAG undertakes projects in every sector including healthcare, education, retail, commercial and residential, completing contracts valued from £250,000 to £5,000,000.

The company offers the most modern, energy efficient glazing and cladding solutions and is actively involved in the development of innovative products that provide a complete engineered solution, such as SYSTEMSTAX.

At the core of EAG's policy to improve people's environments, the company is committed to reducing CO<sub>2</sub> emissions by using the highest performing systems and the latest glass technology available.

Photovoltaic (PV) panels are set to transform the way the envelope contributes to the building's overall reduction in carbon emissions, by using semi-conducting silicone cells to convert light into electricity. As changes in legislation require higher performing envelopes, EAG has embraced this latest technology and is combining it with traditional engineering design to deliver a fully integrated solution.
